IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) A computer-implemented method for inserting breakpoints in a program being debugged, comprising:
selecting branch points in the program being debugged at which to insert breakpoints, the selecting comprising:
identifying a statement for the program being debugged;
determining which basic block contains the statement;
determining which other blocks present in the program control execution of the basic block; and
inserting a breakpoint at each branch point contained in the other blocks controlling present in the program that control execution of the basic block.
2. (Original) The method of claim 1, wherein the statement is the location where the program being debugged halted execution.
3. (Original) The method of claim 1, wherein the blocks controlling execution of the basic block are blocks on which the basic block is control dependent.
4. (Currently Amended) The method of claim 1, wherein identifying the statement comprises identifying a statement in the source code of the program that may modify a program variable.
5. (Original) The method of claim 4, wherein identifying a value of the statement that may modify a program variable comprises accessing a table comprising the variable mapped to statements that may modify the variable.
6. (Original) The method of claim 1, wherein identifying the statement comprises identifying statements associated with loop latches.

PATENT
Atty. Dkt. No. ROC920010085US1
MPS Ref. No.: IBMK10085

7. (Original) The method of claim 6, wherein identifying statements associated with loop latches comprises accessing tables comprising the basic block mapped to the loop latches.
8. (Original) The method of claim 1, wherein identifying the statement comprises identifying a currently executing statement of each of a plurality of subprograms.
9. (Original) The method of claim 8, wherein each of the plurality of subprograms is a portion of the program being debugged and performs a specific task.
10. (Original) The method of claim 8, wherein identifying the currently executing statement comprises accessing a table comprising the plurality of subprograms mapped to its respective currently executing statement.
11. (Currently Amended) The method of claim 8, wherein the other blocks controlling present in the program that control execution of the basic block are blocks on which the basic block is control dependent.
12. (Currently Amended) A computer system comprising at least one processor configured to execute a debugging program, wherein the processor, when executing the debugging program, is configured to perform an operation comprising:
selecting branch points in the program being debugged at which to insert breakpoints, the selecting comprising:
identifying a statement for the program being debugged;
determining which basic block contains the statement;
determining which other blocks present in the program control execution of the basic block; and
inserting a breakpoint at each branch point contained in the other blocks controlling present in the program that control execution of the basic block.
13. (Original) The computer system of claim 12, wherein identifying the statement comprises:
identifying a program variable; and
determining which statements may modify the variable.

PATENT
Atty. Dkt. No. ROC920010085US1
MPS Ref. No.: IBMK10085

14. (Original) The computer system of claim 12, wherein identifying the statement comprises:
determining a plurality of sets of loop latches for the basic block; and
identifying the statements associated with loop latches.
15. (Original) The computer system of claim 12, wherein identifying the statement comprises:
Identifying a currently executing statement of a plurality of subprograms.
16. (Currently Amended) A signal bearing medium, comprising a program which, when executed by a processor, performs an operation, comprising:
selecting branch points in the program being debugged at which to insert breakpoints, the selecting comprising:
identifying a statement for the program being debugged;
determining which basic block contains the statement;
determining which other blocks present in the program control execution of the basic block; and
inserting a breakpoint at each branch point contained in the other blocks ~~controlling present in the program that control~~ execution of the basic block.
17. (Original) The signal bearing medium of claim 16, wherein the statement is the location where the program being debugged halted execution.
18. (Currently Amended) The signal bearing medium of claim 16, wherein the other blocks controlling present in the program that control execution of the basic block are blocks on which the basic block is control dependent.
19. (Currently Amended) The signal bearing medium of claim 16, wherein identifying the statement comprises identifying a statement in the source code of the program that may modify a program variable.
20. (Original) The signal bearing medium of claim 19, wherein identifying the statement that may modify a program variable comprises accessing a table comprising the variable mapped to statements that may modify the variable.

PATENT
Atty. Dkt. No. ROC920010085US1
MPS Ref. No.: IBMK10085

21. (Original) The signal bearing medium of claim 16, wherein identifying the statement comprises identifying statements associated with loop latches.
22. (Original) The signal bearing medium of claim 21, wherein identifying statements associated with loop latches comprises accessing tables comprising the basic block mapped to the loop latches.
23. (Original) The signal bearing medium of claim 16, wherein identifying the statement comprises identifying a currently executing statement of each of a plurality of subprograms.
24. (Original) The signal bearing medium of claim 23, wherein each of the plurality of subprograms is a portion of the program being debugged and performs a specific task.
25. (Original) The signal bearing medium of claim 23, wherein identifying the currently executing statement comprises accessing a table comprising the plurality of subprograms mapped to its respective currently executing statement.
26. (Currently Amended) The signal bearing medium of claim 23, wherein the other blocks controlling present in the program that control execution of the basic block are blocks on which the basic block is control dependent.
